ICS 351: Today's plan

- netmask exercises
- network and subnetwork design
Netmask exercises

- write down decimal equivalents of these binary numbers:
  
  - 0000 0000
  - 1000 0000
  - 1100 0000
  - 1110 0000
  - 1111 0000
  - 1111 1000
  - 1111 1100
  - 1111 1110
  - 1111 1111
Netmask exercises

- for IP 128.171.11.23 with a 20-bit network mask, what is the network number?
- repeat for a 21-bit, 22-bit, and 23-bit network mask
- also compute the broadcast address for each of these cases
Network and Sub-network design considerations

- usually, we are given a range of IP addresses
- must decide how to subdivide them
- usually, the decision of which hosts to attach to which router interface is dictated by connectivity, security, or similar factors
- so must decide which subnetwork gets which addresses
- each subnetwork must have a size that is a power of two (e.g. 64 in prelab 3)
- two addresses in each subnetwork are reserved: all zeros host part gives the network number, all ones host part gives broadcast address
- so if a host part has n bits, the subnetwork can have at most $2^n - 2$ hosts
Network and Sub-network design requirements

- each host in each subnetwork needs a unique IP number
- these can be assigned statically or dynamically
- server machines usually need static IP addresses, whereas client machines can use static or dynamic IP addresses
- static IP addresses must be assigned manually, changing them require overhead and sometimes causes user complaints
- dynamic IP addresses are assigned by DHCP, can be changed relatively easily
- (usually) we cannot easily get new IP numbers, and the future can be uncertain!
Rational Sub-network Design

- figure out network, subnetwork, and sub-sub-network (etc) topology
- figure out the minimum current size for each subnetwork
- if additional addresses are available, estimate future growth of each subnetwork
- dynamic addresses can be reassigned more easily, so it is OK to be more generous with dynamic addresses
- if the future is uncertain, adopt a reasonable policy, e.g. all subnetworks have 27-bit netmasks and subnetworks numbers are handed out as needed
Network Design Exercise

- three routers, A, B, and C, each connected to the other two
- router A is also connected to the wider internet
- router A connects to three other subnetworks:
  - o X, with at least 10 static addresses and 20 dynamic addresses,
  - o Y, with at least 50 dynamic addresses,
  - o and Z, with at least 2 static addresses.
- router B connects to two other subnetworks:
  - o H, with at least 5 static addresses but a good chance of future growth, and
  - o K, with at least 30 dynamic addresses and 30 static addresses
- router C connects to two other subnetworks:
  - o P, with at least 5 static addresses
  - o Q, with at least 5 dynamic addresses
- You have been given the IP address range 10.11.12.0/24
- assign IP addresses for this network
