## HORT/AGRON/ANSC 603

Final Exam

December 17, 1999

1. An experiment to test the effect of dietary chocolate on levels of the stress hormone cortisol in graduate students is designed with 6 treatments and 6 replicates. Give the sources and degrees of freedom and indicate all F-tests for the fixed model with arrows given the following conditions:
A. The experiment is installed as a completely randomized design.

| Source | df |
| :--- | :--- |
| Bet Trt | 5 |
| Within Trt | 30 |
| Total | 35 |

B. The experiment is installed as a randomized complete block design (RCBD), with students blocked on previous academic performance.

| Source | df |
| :--- | :--- |
| Total | 35 |
| Trt | 5 |
| Rep | 5 |
| Error | 25 |

C. The experiment is installed as a Latin square design with 6 students (columns) each receiving each treatment over 6 time periods (rows).

| Source | df |
| :--- | :--- |
| Total | 35 |
| Trt | 5 |
| Col | 5 |
| Row | 5 |
| Error | 20 |

D. The experiment is installed as a RCBD and 4 blood samples are taken from each student.

| Source | df |
| :--- | :--- |
| Total | 143 |
| Trt | 5 |
| Rep | 5 |
| Expt error | 25 |
| Sample error | 108 |

E. The experiment is installed as a RCBD and sugar intake is measured as a covariate.

| Source | df |
| :--- | :--- |
| Total | 35 |
| Rep | 5 |
| (Trt + Error | $30)$ |
| Trt | 5 |
| A. Regr (Adj for Trt) omitted) | 1 |
| Regr | 1 |
| B. Trt (Adj for Regr) | 5 |
| Dev Regr + Trt | 24 |

F. The experiment is installed as a RCBD and the treatments are 6 equally spaced levels of chocolate in the diet. Divide up the treatment degrees of freedom appropriately.

| Source | df | or |  |
| :---: | :---: | :---: | :---: |
| Total | 35 | Trt |  |
| Rep | $5 \square$ | Lin | 1 |
| (Trt | 5) | Quad | 1 |
| Regr | 1 | Cubic | 1 |
| Dev Regr | 4 - | Quartic | 1 |
| Error | 25 - | Quintic | 1 |
|  |  | Error | 25 - |

G. The experiment is installed as a RCBD and the treatments are 2 levels of sugar and 3 levels of chocolate arranged in a $2 \times 3$ factorial. Divide up the treatment degrees of freedom appropriately.

| Source | df |
| :--- | :--- |
| Total | 35 |
| Rep | 5 |
| (Trt | $5)$ |
| Sug | 1 |
| Choc | 2 |
| $\quad$ S*C | 2 |
| Error | 25 |

H. The experiment is installed as a split plot with 2 levels of previous chocolate intake in the main plot and 3 levels of added chocolate in the split plot.

| Source | df |
| :--- | :--- |
| Tot | 35 |
| Prev C | 1 |
| Rep | 5 |
| Error A | 5 |
| Add C | 2 |
| Pre*Add | 2 |
| Error b | 20 |
