## Formula for Calculating Number of Replicates

$$
\begin{aligned}
& r \geq 2 \frac{C V^{2}}{D^{2}}\left(t_{1}+t_{2}\right)^{2} \\
& r \geq 2 \frac{s^{2}}{d^{2}}\left(t_{1}+t_{2}\right)^{2}
\end{aligned}
$$

r = number of reps
CV = coefficient of variation
D = true difference it is desired to detect as a \% of mean
$\mathrm{t}_{1}=$ tabular t value for a specified level of significance and df for error
$t_{2}=$ tabular $t$ value for df for error and a probability of 2(1-P), where $P$ is the probability of detecting a significant result in a particular experiment
s = standard deviation
d = true difference it is desired to detect

Options for Obtaining the Desired Number of Replications

| Conditions | D | CV | $\mathrm{t}_{1}$ | $\mathrm{t}_{2}(\mathrm{P})$ | r |
| :--- | :---: | :---: | :---: | :---: | :---: |
| 100 bu | $10 \%$ | $10 \%$ | $1 \%$ | $95 \%$ | 37 |

| ${\text { Reduce } t_{1} \& P}^{\text {\& }}$ | 10 | 10 | 5 | 90 | 22 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Increase D | 20 | 10 | 5 | 90 | 7 |
| Reduce CV | 10 | 5 | 5 | 90 | 7 |
| Reduce P | 10 | 10 | 5 | 80 | 17 |
