## Book

Paradis (2006) Analysis of phylogenetics and evolution with R. Springer (Use R! series)

# Ancestral State Reconstruction or Ancestral State Estimation

# Ancestral State Reconstruction

# Ancestral State Reconstruction

Infer how traits have changed  
through time

# Ancestral State Reconstruction

Infer how traits have changed  
through time

↓

Visualize/identify complex  
macroevolutionary/macroecological patterns

# Evolution of Size in Whales

# Ancestral State Reconstruction

- Reconstruction methods
  - Squared-change parsimony
    - Weighted or unweighted
  - Maximum likelihood
  - Generalized least squares (GLS)
  - Bayesian

# Ancestral State Reconstruction

- Reconstruction methods
    - Squared-change parsimony
    - Maximum likelihood
    - GLS
    - Bayesian
-  Ape package  
ace function

# Ancestral State Reconstruction

- Reconstruction methods
  - Squared-change parsimony
  - Maximum likelihood
  - GLS  `ace method="GLS"`
    - ↓
    - \*Caveat\* this method is unstable and can generate unusual error messages. Use at your own risk!

# Ancestral State Reconstruction

- **Squared-change parsimony**
  - Minimizes evolutionary change across the tree
  - Unweighted ignores branch length information
  - Weighted incorporates branch length information
- **Maximum likelihood**
  - Most likely set of ancestral states when whole phylogeny is considered
  - Incorporates branch length information
  - Evolutionary model to estimate rate of evolution  
(Brownian motion currently implemented in R)

# Evolution of Size in Whales

Max. likelihood = 1010cm

Unweighted  
squared-change  
parsimony = 951cm

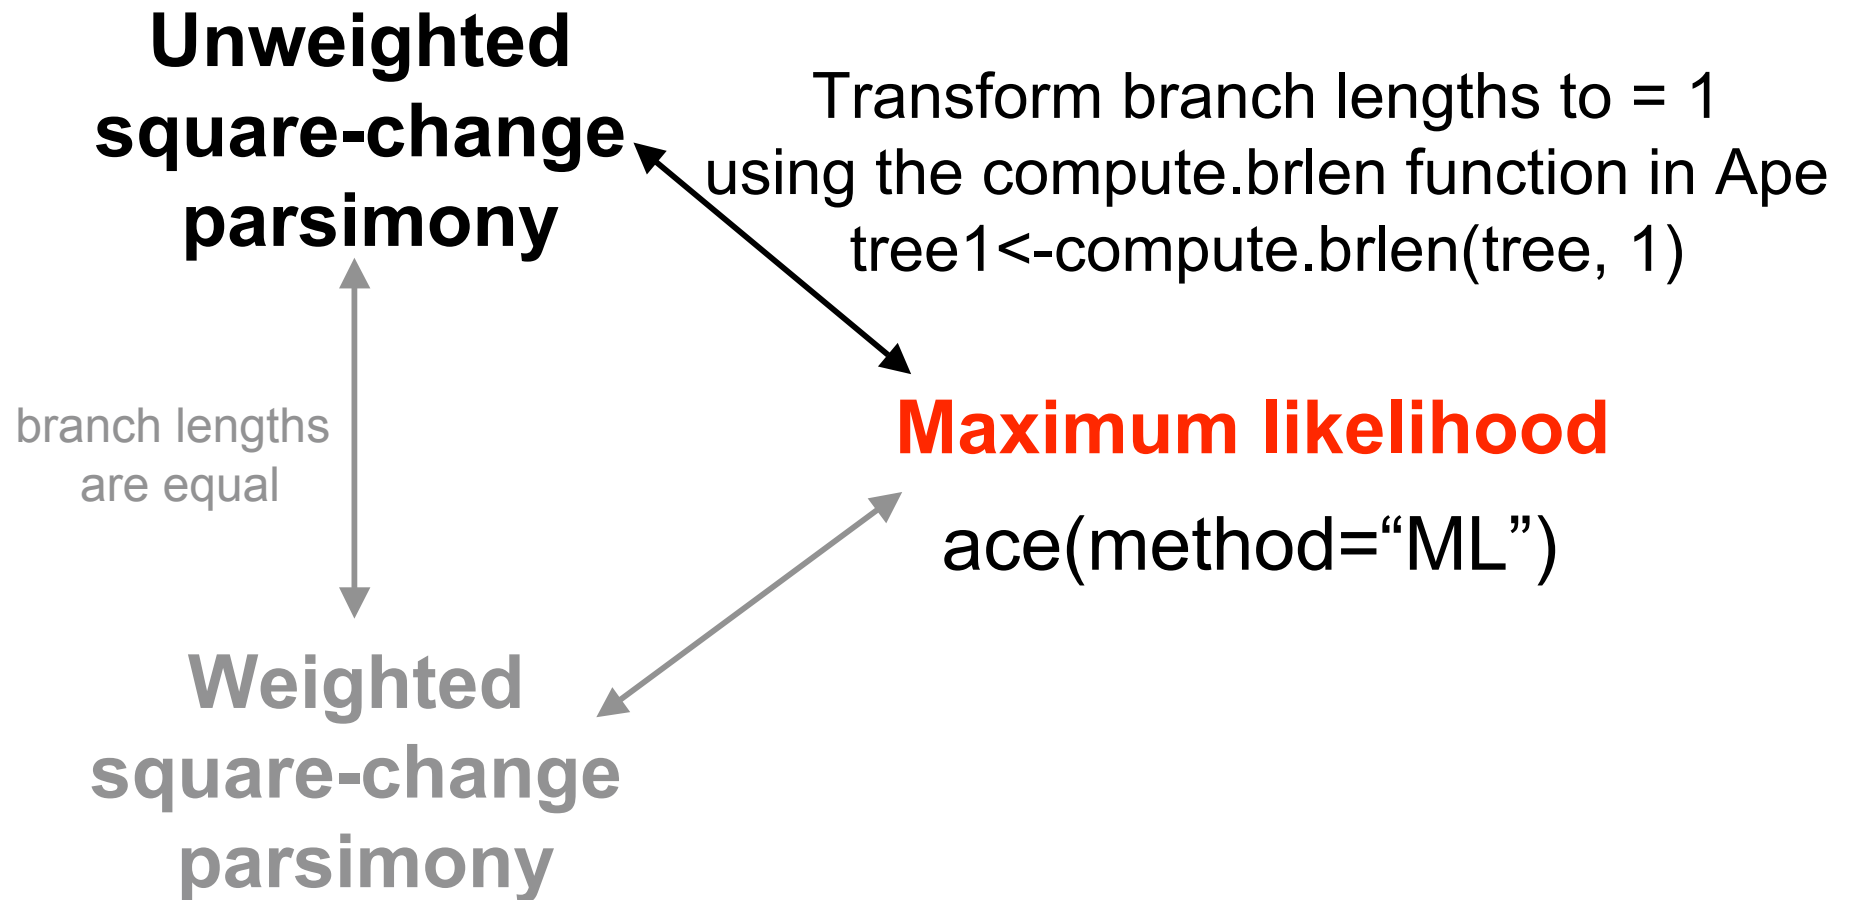

# Ancestral State Reconstruction

# Implementation

# Ancestral State Reconstruction

Discrete traits in 

- Maximum likelihood used to fit Markovian models of discrete character evolution.

`ace(type=discrete)`

# Ancestral State Reconstruction

Discrete traits in

- Maximum likelihood used to fit Markovian models of discrete character evolution. `ace(type=discrete)`

**Equal**

| Character<br>states | 1 | 2 | 3 |
|---------------------|---|---|---|
| 1                   | 0 | 1 | 1 |
| 2                   | 1 | 0 | 1 |
| 3                   | 1 | 1 | 0 |

**Symmetrical**

|   | 1 | 2 | 3 |
|---|---|---|---|
| 1 | 0 | 1 | 2 |
| 2 | 1 | 0 | 3 |
| 3 | 2 | 3 | 0 |

**All-rates different**

|   | 1 | 2 | 3 |
|---|---|---|---|
| 1 | 0 | 1 | 2 |
| 2 | 3 | 0 | 4 |
| 3 | 5 | 6 | 0 |

# Ancestral State Reconstruction

Discrete traits in 

- Maximum likelihood used to fit Markovian models of discrete character evolution.

## Equal

| Character states | 1 | 2 | 3 |
|------------------|---|---|---|
| 1                | 0 | 1 | 1 |
| 2                | 1 | 0 | 1 |
| 3                | 1 | 1 | 0 |

`ace(type=discrete,  
model="ER")`

## Symmetrical

|   | 1 | 2 | 3 |
|---|---|---|---|
| 1 | 0 | 1 | 2 |
| 2 | 1 | 0 | 3 |
| 3 | 2 | 3 | 0 |

`ace(type=discrete,  
model="SYM")`

## All-rates different

|   | 1 | 2 | 3 |
|---|---|---|---|
| 1 | 0 | 1 | 2 |
| 2 | 3 | 0 | 4 |
| 3 | 5 | 6 | 0 |

`ace(type=discrete,  
model="ARD")`

# Disparity

**Measure of morphological diversity**

# Disparity

**Evolution of diversity --> species richness --> morphological richness**

- Are taxonomically rich clades also morphologically diverse?
- How does morphological diversity relate to ecological differences?

# Disparity

## Measure of morphological diversity

- Sample-size independent
  - Average pair-wise distance between points in morphospace

# Disparity

## **Measure of morphological diversity**

- Sample-size independent
- Geiger package 
  - Average-squared Euclidean distance, if all axes are in the same units.
  - Average-Manhattan distance (sum of the absolute differences of their coordinates)

Harmon et al. 2003, Science 301: 961-964

# Disparity

## Geiger package

1. Disparity across the whole tree (compare to other clades).
  - Average pair-wise distance in morphospace between all species in the dataset

# Disparity

## Geiger package

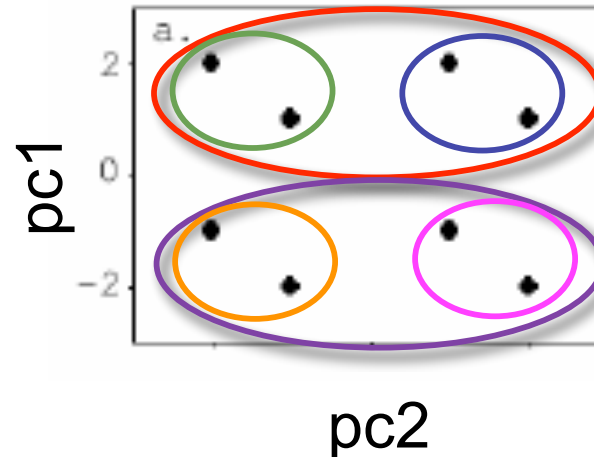

1. Disparity across the whole tree (compare to other clades).
2. Disparity for every clade in the phylogeny
  - Average pair-wise distance in morphospace between all species in the clade

# Disparity

## Geiger package

1. Disparity across the whole tree (compare to other clades).
2. Disparity for every clade in the phylogeny
  - Average pair-wise distance in morphospace between all species in the clade

# Disparity

## Geiger package

1. Disparity across the whole tree (compare to other clades).
2. Disparity for every clade in the phylogeny

### 3. Disparity through time

Does disparity correspond to clade differences?

# Disparity

## Geiger package

1. Disparity across the whole tree (compare to other clades).
2. Disparity for every clade in the phylogeny

### 3. Disparity through time

- Relative disparity for each node  
(disparity for clade/whole tree disparity)
- Calculate at each divergence event average relative disparity for each sub-clade present at that time period.

# Disparity

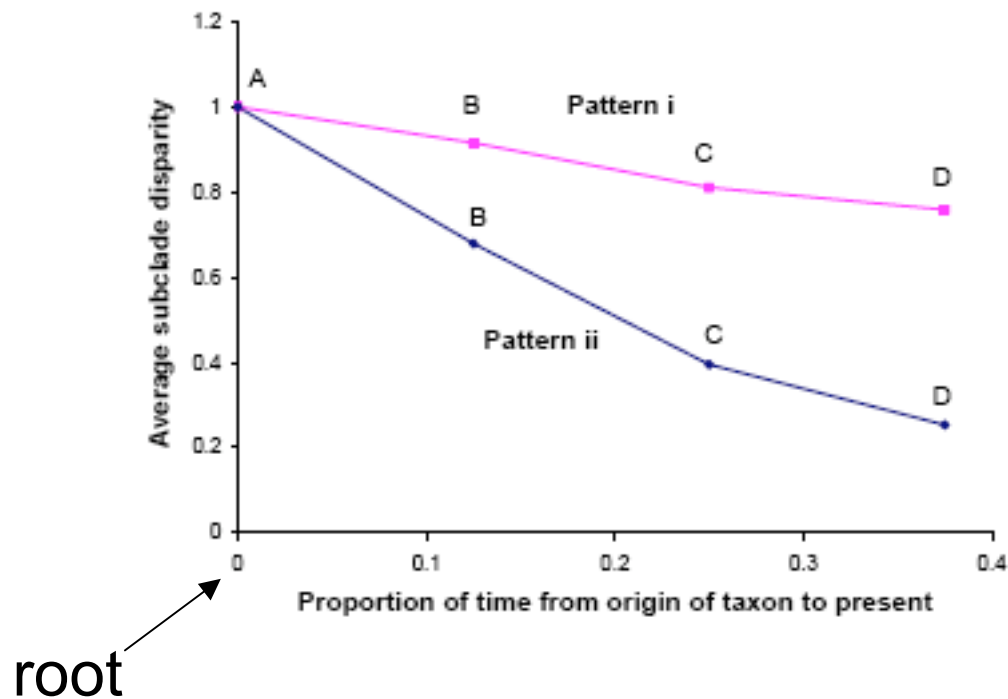

## 3. Disparity through time

- Relative disparity for each node  
(disparity for node/whole tree disparity)
- Calculate at each divergence event average relative disparity for each sub-clade present at that time period.

# Disparity

## 3. Disparity through time plots

# Disparity

## 3. Disparity through time

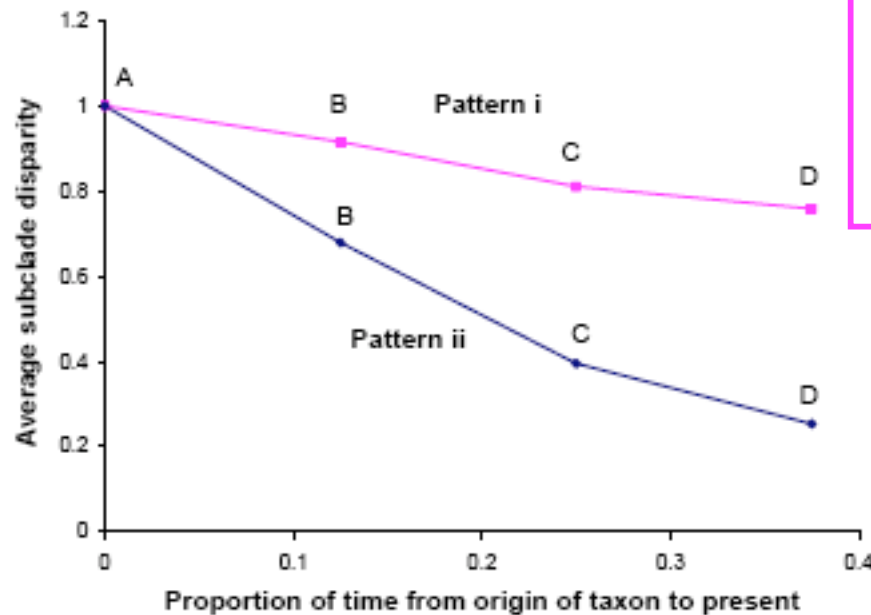

High average disparity through time = variation within sub-clades

Decreasing average disparity through time = variation between sub-clades

# Disparity

## 3. Disparity through time

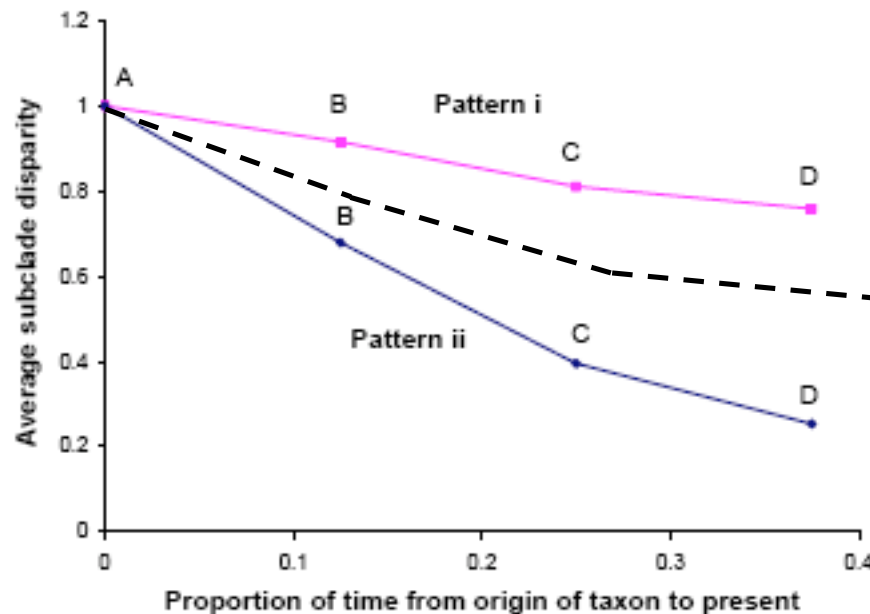

Morphological convergence.  
Sub-clades overlap each other in morphospace

No morphological convergence - sub-clades occupy different morphospaces

# Disparity

## 3. Disparity through time

Null expectation  
(morphological  
datasets simulated  
on the phylogeny)

# Disparity

## 3. Disparity through time - Iguanian lizards
